## The App!

The Inventory Management App is an all-in-one place where an employee or customer can interact live with the current inventory.

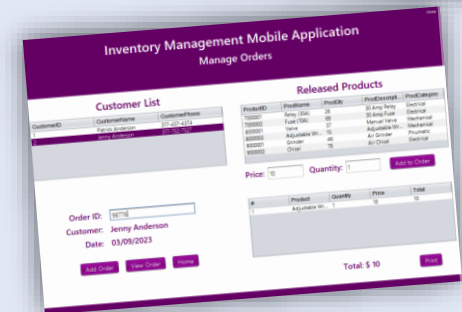

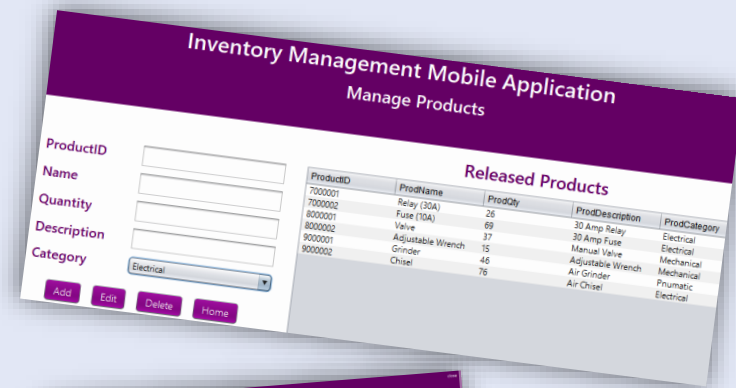

- The Manage Products page lets a user view all current released products in the system and add, edit delete, or search records in the system for maintainability.
- The Manage Orders page lets a user place an order and deducts inventory from the system as items are added to the Order, ensuring inventory accuracy!
- The Manage Customers page lets a user maintain a current customer list with the ability to add, edit delete, or search a Customer record!

- The Manage Categories page allows the business to better Categorize their products!

- The Manage Users page lets a User be added and given log in credentials.

## Updated Features!

- Search functionality
- Limited Access for Specific Users

Any mobile devices that support the Java language can operate the App.

All data the app utilizes is stored in a local database
